AB . New plugging mortar is used for drilling oil and gas wells in formations
    with abnormally high pressures within temp. range of 60-140.degree..
    Grouting mortar contains Portland cement 15.38-25.74, barite
    22.06-46.15, power station fly ashes 15.38-25.74 wt.%, and water
    in the balance. Portland cement is first mixed with fly ashes
    and resulting mixt. is then introduced into vacuum hydraulic mixer
    simultaneously with 70-80 wt. % of barite based on its projected amt. and
     water fed under pressure. The obtained slurry is
    stirred and hydraulically activated in hydraulic mixer. After addn. of
    the rest of barite, hydraulic activation of soln. is repeated several
     times at pressure of 8-12 MPa. The resulting grout has increased heat
    resistance and strength of cement stone.
